Model summary rows: 75
Selected outer-metric rows: 5

Selection lock
- Outer CV determines winning pipeline; full-train performs refit-only of locked choices.
- No re-selection at full train stage.
- Selection score: mean_rmse_w + lambda_tail*(mean_tail_rmse_w/mean_rmse_w) + lambda_xtail*(mean_xtail_rmse_w/mean_rmse_w) + lambda_disp*|log(disp_ratio_w)| + lambda_cap_hit*s_cap_hit_rate + lambda_tbias*|tail_bias_w| + lambda_tdisp*|log(tail_disp_ratio_w)| + lambda_stability*std_rmse.

## Validation Design

Nested expanding CV (leakage-safe)

Outer fold k:

- train(earlier dates) -----> val(later dates)
- 1) Fit fold-local ratings/features on outer-train only.
- 2) Train base regressor on outer-train.
- 3) Build inner expanding splits within outer-train.
- 4) Generate inner OOF base predictions.
- 5) Fit postprocessor on inner OOF only.
- 6) Apply postprocessor to outer-val predictions.

No game uses future outcomes for its own features/prediction.

Outer folds:

```
fold 1: train 2025-01-01..2025-01-12 | val 2025-01-23..2025-02-19
fold 2: train 2025-01-01..2025-02-19 | val 2025-03-03..2025-04-02
fold 3: train 2025-01-01..2025-04-02 | val 2025-04-14..2025-04-30
fold 4: train 2025-01-01..2025-04-30 | val 2025-05-13..2025-05-29
fold 5: train 2025-01-01..2025-05-29 | val 2025-05-30..2025-06-30
```

## Dispersion and Ratings

Affine dispersion correction derivation

Given  $y_{\hat{}} = a + s p$ , minimize  $E[(y - (a + s p))^2]$ .

Set partial derivatives to zero:

$d/da: E[y - a - s p] = 0 \rightarrow a = E[y] - s E[p]$

$d/ds: E[p(y - a - s p)] = 0$

Substitute  $a$  and solve:

$s^* = \text{Cov}(p, y) / \text{Var}(p)$

$a^* = \text{mean}(y) - s^* \text{mean}(p)$

Fallback when covariance/variance unstable:  $s \approx \text{std}(y)/\text{std}(p)$ .

Illustrative prior baseline ratio  $\text{std}(y)/\text{std}(p)$ : 1.668 (43.62/26.15).

Expansion slope rule (anti-compression under under-dispersion):

```
r_base = std(p_oof_train) / std(y_train)
if r_base < 0.90: choose s = max(1.0, eta * naive_r), eta in {0.55,0.60,0.65,0.70}
where naive_r = std(y_train) / std(p_oof_train)
else: s = clip(s_star, 0.8, 1.2)
then recompute a = mean(y) - s*mean(p) with selected s
```

Rating methods

- Massey ridge anchor:  $\text{margin} = r_{\text{home}} - r_{\text{away}} + h + \text{eps}$ ; neutral inference uses  $h=0$ .
- EloK is secondary feature only (pregame diff, optional linear K-decay).
- EloK is never allowed as standalone model family.

## Failure Analysis

Failure analysis of 308 run

- Early fold instability produced fold-1 RMSE blowups (observed near ~70).
- Affine slope expansion could overshoot in small-OOF folds (observed s near ~2.6).
- Over-dispersion appeared in selected configs (dispersion ratio > 1.05), hurting generalization.
- 1SE + simplicity-first tie-break could pick brittle configs over better-scoring alternatives.

## Guardrails Added

### Guardrails added

- Stability lambda enforced: `lambda_stability` in {0.10, 0.20} (no zero).
- Selection uses weighted fold metrics (0.10, 0.15, 0.20, 0.25, 0.30) to emphasize late season.
- Eta search restricted to {0.55, 0.60, 0.65, 0.70}; higher eta values (0.8/0.9/1.0) removed.
- Cap-hit penalty in score and cap-hit rejection gate to avoid selecting cap-bound calibrations.
- Hard gates: `max_fold_rmse`, `fold1_rmse`, `mean_dispersion_ratio` upper bound, tail-dispersion, under-dispersion expansion checks.
- Score-first 1SE tie-break: sort by score first, simplicity only as tie-break.
- Massey alpha grid hardened: removed alpha=0.1; using {1.0, 10.0, 50.0}.
- Expansion slope caps by inner OOF size: n<120=>1.25, <200=>1.35, <300=>1.45, else 1.60.
- CV-only over-dispersion correction: if fold disp>1.10 (or 1.15 for `n_oof`>=300), one-step slope shrink; reject if still above threshold.
- Piecewise tail eligibility gate: allowed only when `max_fold_rmse`<=45 and `mean_disp` in [0.75, 1.00].

## Results Summary

Global vs regime scaling comparison

- Candidate postprocessors included: none, expand\_affine\_global, expand\_regime\_affine\_v2, expand\_regime\_affine\_v2\_heterosk, expand\_piecewise\_tail\_v2.
- Locked module: expand\_affine\_global

Tail and dispersion diagnostics (outer OOF for selected config)

- Tail RMSE improvement vs base: 4.2193
- Extreme Tail RMSE improvement vs base: 4.7934
- Dispersion ratio base: 0.4901
- Dispersion ratio final: 0.6819
- Dispersion moved toward 1.0: True
- Tail dispersion ratio final: 0.4806

Selected dispersion expansion parameters

- r\_base=0.49057701866105907, naive\_r=2.0384159101649693
- s\_star=1.0533373677158486, chosen\_s=1.4268911371154784, eta=0.7
- tail\_q=None, tail\_t=None, tail\_k=None

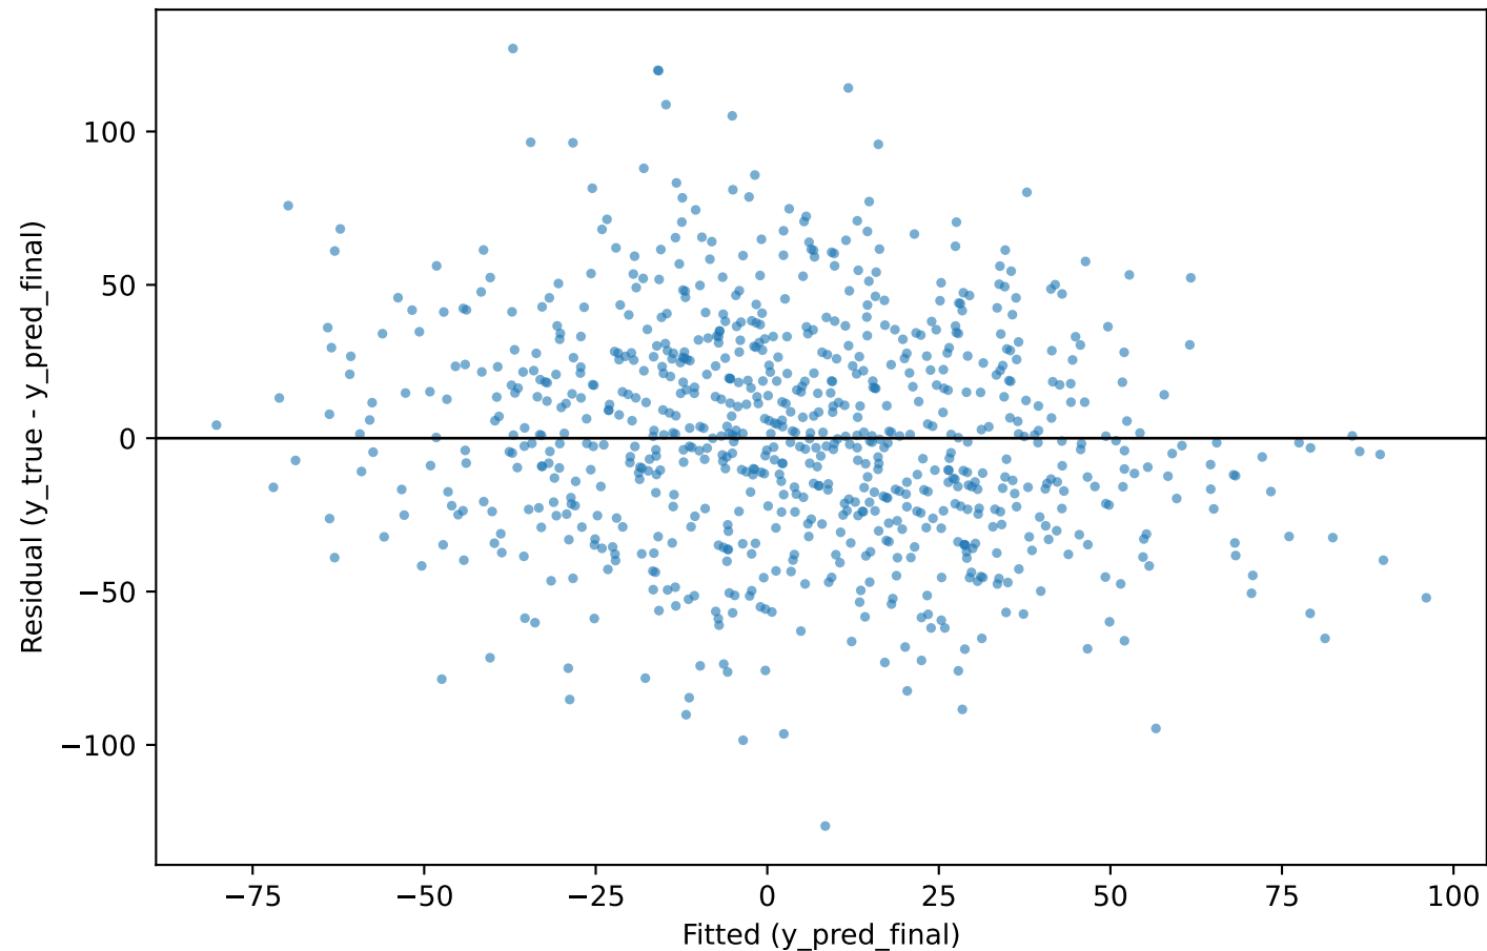

Derby prediction distribution summary

- n=75 (asserted)
- mean=-4.3735
- std=26.9047
- p05=-51.3123
- p50=-3.5257
- p95=40.8838

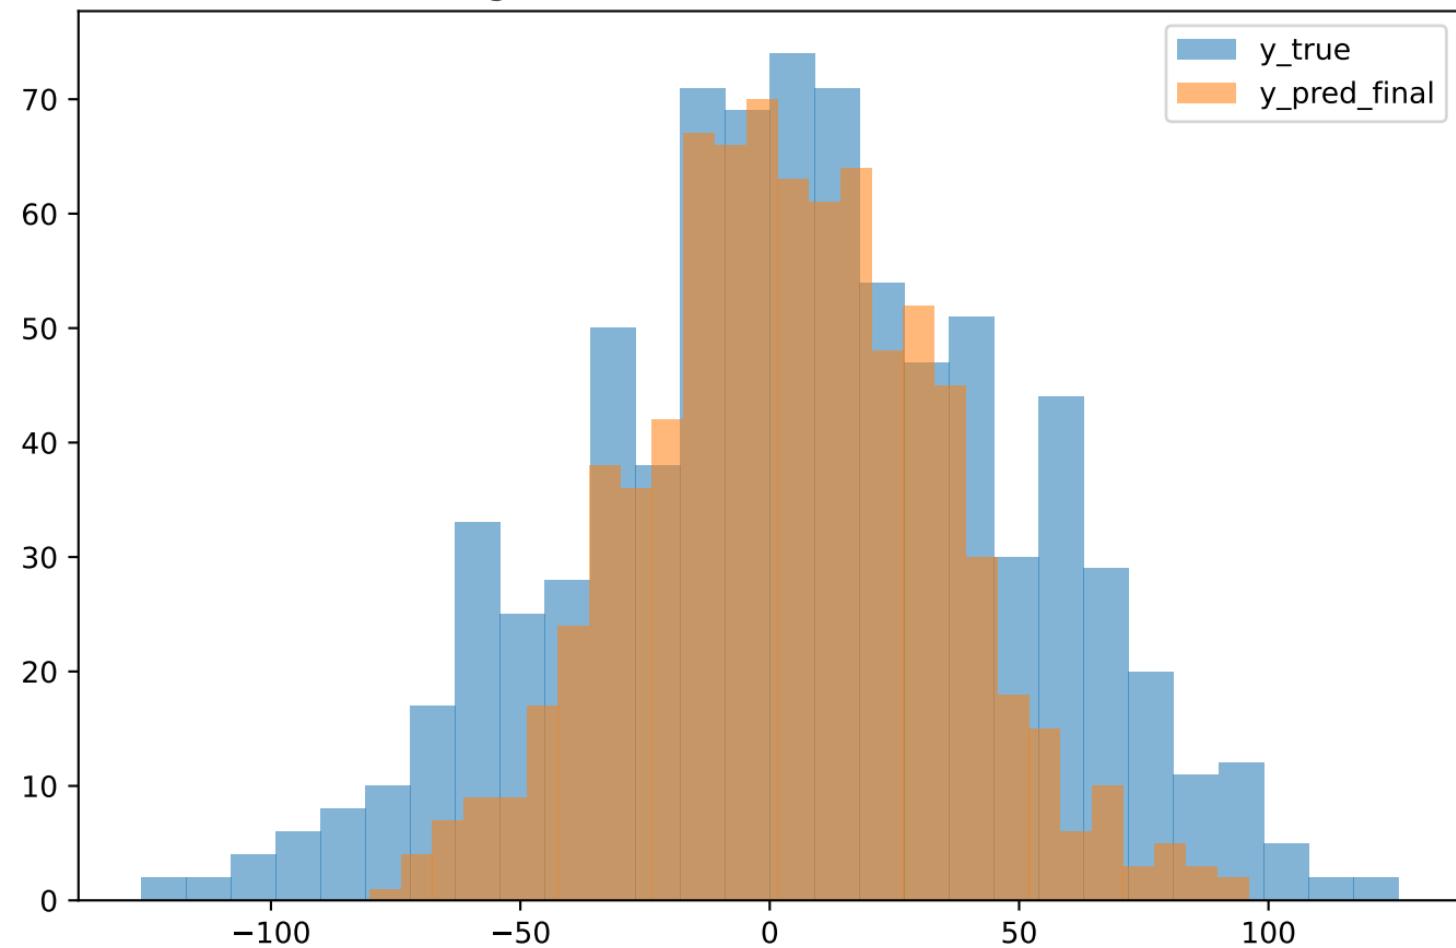

Selection lock details

- Rating-stage lambda\_tail chosen: 0.1
- Rating-stage lambda\_xtail chosen: 0.05
- Rating-stage lambda chosen: 0.1
- Rating-stage lambda\_disp chosen: 0.05
- Rating-stage lambda\_cap\_hit chosen: 0.0
- Rating-stage lambda\_tbias chosen: 0.0
- Rating-stage lambda\_tdisp chosen: 0.05
- Model-stage lambda\_tail chosen: 0.1
- Model-stage lambda\_xtail chosen: 0.05
- Model-stage lambda chosen: 0.1
- Model-stage lambda\_disp chosen: 0.05
- Model-stage lambda\_cap\_hit chosen: 0.0
- Model-stage lambda\_tbias chosen: 0.0
- Model-stage lambda\_tdisp chosen: 0.05
- Selection gate rejections count: 55
- Massey-only gate applied: False
- Massey-only gate reason:

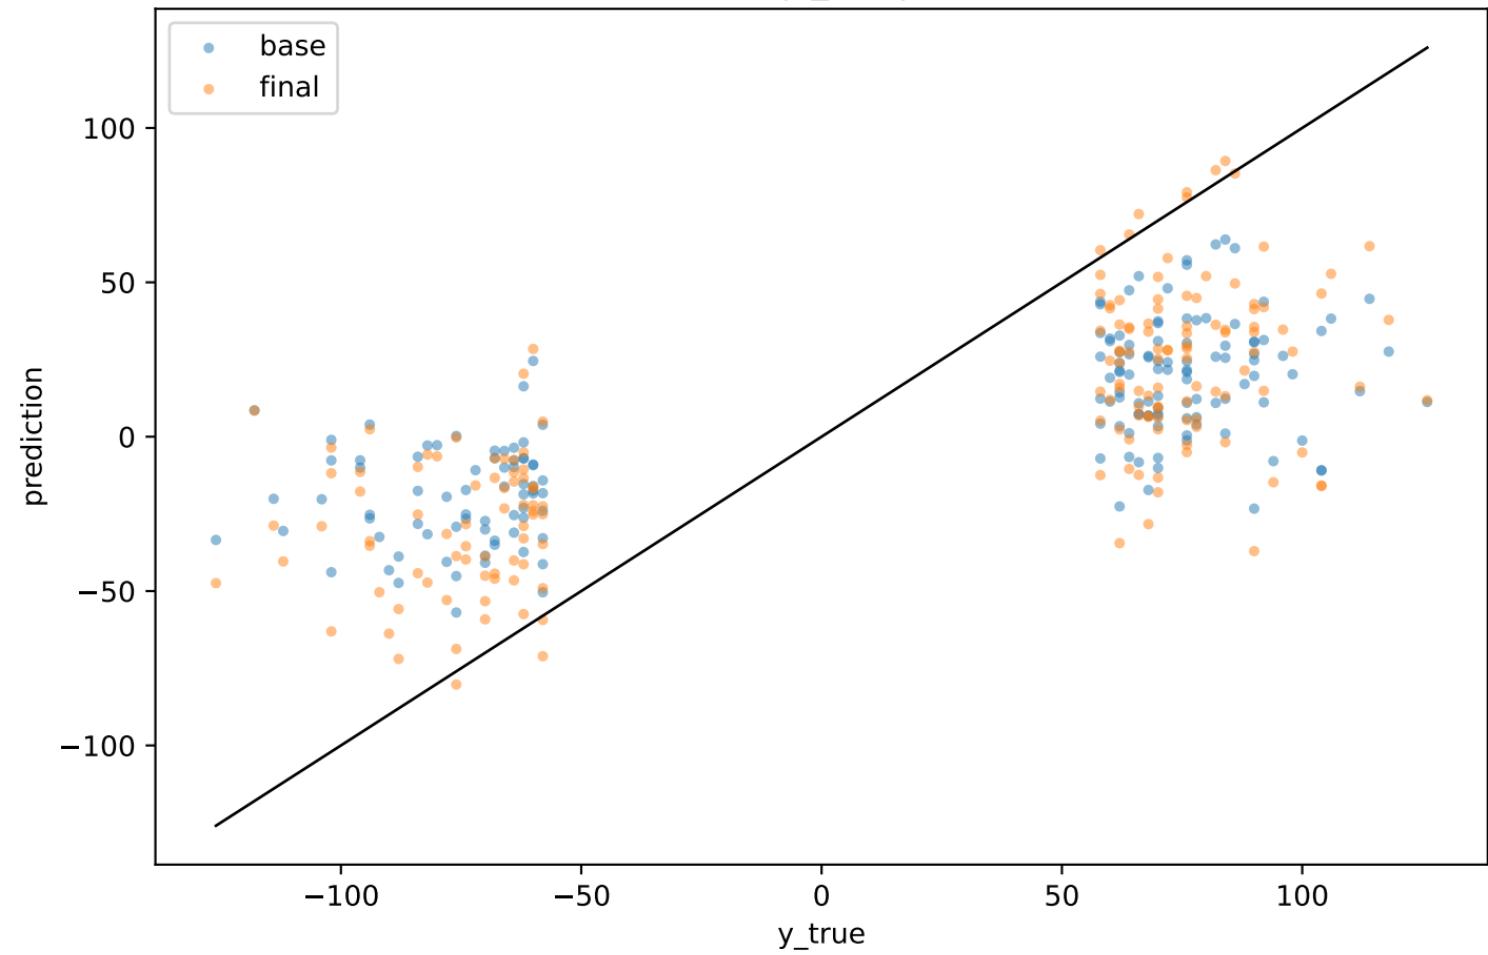

### Residual vs Fitted (OOF Final)

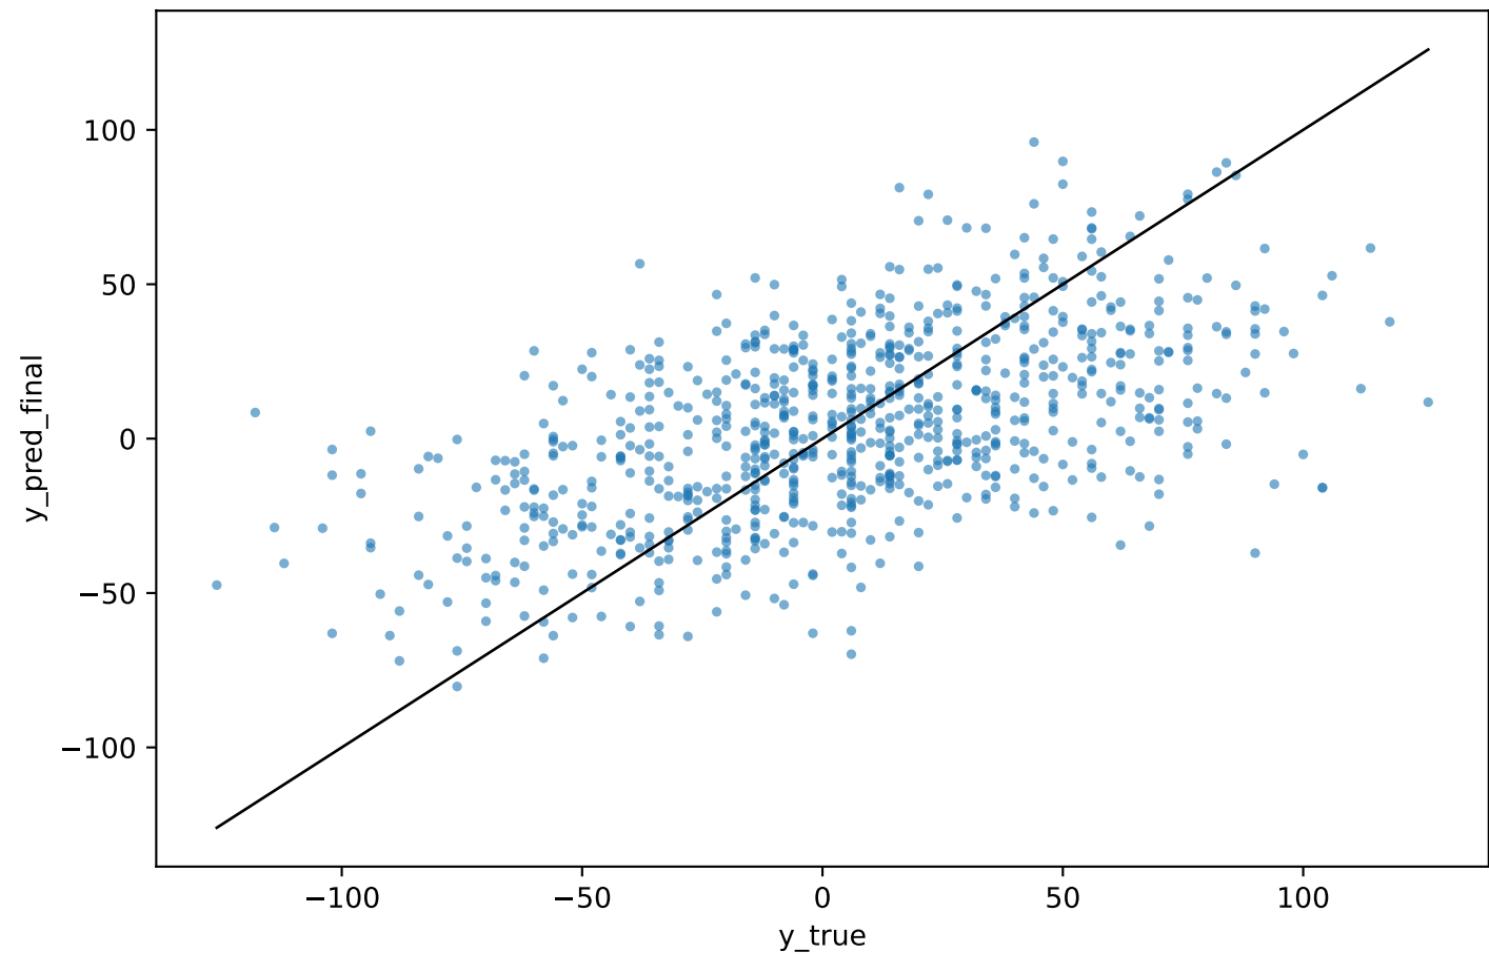

# Histogram: OOF Actual vs Final Predictions

Tail Scatter ( $|y_{\text{true}}|$  top 20%)

Prediction vs Actual (OOF Final)

### Dispersion Ratio by Fold (std(pred)/std(y))
